GLOBAL  
**CUTTER**  
shaping technology

---

The Global Cutter is designed and created by world leaders in halfpipe shaping.

shaping technology

The Global Cutter is extensively tested and produced by specialist snow cat operators, engineers and riders all dedicated to exceptional halfpipes.

## The inspiration behind the Global Cutter was to change the face of halfpipe shaping.

Produced by Development Snowparks the Global Cutter is one of only two halfpipe shapers on the market to shape a 22' Olympic specification halfpipe. It is also available in 13', 15' and 18' models.

The Global Cutter, with it's unique design, aims to create the perfect ride.

shaping technology

## It's the shape riders want

Attract more riders to your resort with the Global Cutter's unique shape. The transition created by the Global Cutter creates a smoother take off with a safer, wider landing. This is optimal for riders as it allows them to carry speed throughout their run, go higher out of the pipe and execute more technical tricks.

## The perfect ride

A rider's enjoyment is enhanced when they achieve efficient edging in a halfpipe. The Global Cutter uses a heated pressure bar and pressure mat to leave a smooth corduroy finish for the perfect ride.

## Save on build time, snow cat operation and snow, with the laser guidance system.

The Global Cutter uses a unique and innovative laser guidance system for accurate and efficient shaping. It will save a resort 15% per season in snow cat hours and snow usage throughout the entire build process as well as over the course of the season. The laser guidance system is essential to every part of the pipe build process and nightly shaping - from grade setting to straight line pushing. It is also used for straight line cutting and doubles as the vert gauge when nightly shaping.

## The laser guidance system

## Lower your pipe operating and maintenance costs

The Global Cutter has been built with a robust, powerful and effective cutting system that ensures your operators save time and snow. It's bi-directional paddle system reuses and reapplies snow to the wall filling holes and air pockets. Its high torque, low speed cutting method means it won't stall either.

shaping technology

## Totally versatile for any snow conditions

Extend your halfpipe operating season due to low nightly snow usage with the Global Cutter. Its ability to perform effectively in either icy or spring like conditions gives your operator options for achieving the best possible cut with minimal snow usage.

## World class service

The Global Cutter comes with an extensive support package. Upon delivery of the Global Cutter your resort can receive a full halfpipe commissioning service that includes an initial build and shaping as well as comprehensive operator training. Add to this a continued and dedicated support service and you have a world class product.
